# INTRODUCTION

# BACKGROUND

---

According to the 2000 Pulse Survey, 94% of Filipinos believe in the importance of managing one's fertility and in planning one's family. With this data, one is tempted to conclude that family planning is already socially acceptable in the Philippines. On the other hand, the 1998 National Demographic Health Survey (NDHS) reports that only 28% of married women of reproductive age (MWRA) used modern contraceptives. Another 18% of MWRA used traditional methods of family planning, and still another 20% expressed a desire to either space their next child or not have any more children but were not using any contraception, i.e., these women had an unmet need (for reliable family planning methods). Added together, the current and potential market for family planning in the Philippines in 1998 should have been about 66% or two thirds of MWRA, which would be a very respectable contraceptive prevalence rate.

However, fertility levels are not dropping to the expressed desires of married women. On the average, Filipino women are having one more child than they would like to have. The reason for this is that the majority of Filipino women is not using reliable methods of modern contraception or have tried these methods but discontinued usage. The reason for low usage of modern contraceptives, or "artificial contraceptives" as the Catholic Church refers to them, is not religion per se. Based on the 1998 NDHS, only 5% of non-user MWRA said they do not use contraceptives because of their religion. Conversely, nearly one-third of non-users and nearly 50% of pill, IUD and injectable discontinuers (aggregate percentage over a five-year period preceding 1998) said that they do not use or stopped using modern contraceptives because of side effects or health concerns. In the more recently published 2002 Family Planning Survey, results revealed that only 2% of currently married women did not use contraception due to prohibition by religion; while a sizable 26% cited health concerns and fear of side-effects as their reasons for not using contraceptives.

# BACKGROUND

In both 1998 NDHS and 2002 FPS surveys, it can be inferred that Health Providers, particularly from the public health sector, are prominently the main source of contraceptive supply among current users of modern contraceptive methods (7 out of 10 current users of modern contraceptive methods obtain their supply from public health facilities while about 3 out of 10 do so from the private health facilities/practitioners).

A secondary review of past studies identified some of the key barriers to modern contraceptive use among women and to a lesser extent, has identified some barriers and biases among medical providers. The review has established that there are significant barriers for hormonal contraceptive methods; misunderstanding of the biological purpose of menstruation among many Filipino women, and husbands' major influence in getting their wives to stop using modern contraceptives without offering to take up a male method of contraception such as condom use or vasectomy.

On attitude of medical providers, the secondary review showed that many have biases toward modern contraceptives, particularly injectable and IUD. ***Provider concerns about contraceptives frequently echo those of their clients, particularly with respect to issues such as amenorrhea. Moreover, the provider's personal or religious values frequently influence their behavior.*** For example, the secondary review showed that over half of 500 Health Providers surveyed in 1995 feel it is inappropriate to prescribe contraceptives to nulliparous women and nearly half conceded their religious beliefs influence their attitude towards prescribing contraceptives. In addition, one out of five providers agreed with the statement that IUDs are an abortifacient.

Recent focus group discussions with contraceptive users and non-users and “frontline” medical providers have confirmed the aforementioned barriers still exist and have identified additional barriers.

# BACKGROUND

---

The Academy for Educational Development (AED), particularly The Social Acceptance Project - Family Planning (TSAP-FP) division, has been awarded a contract from USAID/Philippines entitled, *“Strengthening the Acceptance of Family Planning in the Philippines.”* The goal of the project is to contribute to a greater social acceptance of family planning among the Filipino public. The project will apply communication, advocacy and social mobilization strategies targeted at the general public, health service providers, opinion leaders and influentials and decision-makers to openly support family planning programs and practice. The project has three components: Behavior Change Communication, Advocacy and Social Mobilization and Health Provider Component.

In line with its Health Provider Component and recognizing that health service providers play a key role in providing information and counseling on family planning and user of methods to the general public, a study is being commissioned to look into the prevailing knowledge, attitudes, beliefs and practices among family planning health care providers in public health facilities/hospitals and industry clinics. The study is meant to help develop interventions in selected project sites that will equip health care providers with the correct and latest research-based information on specific family planning methods to counter whatever personal biases, misperceptions or misinformation they have on the different family planning methods. Ultimately, an increase in acceptance of family planning as part of the routine health package in public health facilities/hospitals and industry clinics can be achieved.

# OBJECTIVES

---

1. To determine the level of knowledge on reproductive health and on the mechanism of action and side-effects of specific *modern* family planning methods – namely, oral pill, injectable, IUD, male and female sterilization, among Health Providers;
2. To determine the attitudes, beliefs and biases, and misconceptions of Health Providers on specific family planning methods;
3. To identify prevailing practices of Health Providers related to providing information and prescribing usage of family planning methods;
4. To find out how Health Providers keep themselves updated on medical science in general and on their specific knowledge of Evidence-Based Medicine (if at all);

# VOLUME I

# **CENSUS OF HEALTH PROVIDERS IN PUBLIC HEALTH FACILITIES AND INDUSTRIAL CLINICS**

# TECHNICAL DETAILS

## LOCATION

To carry out the objectives of the study, a census of Health Providers offering family planning services had to be conducted in the designated study areas prior to the actual survey:

<b>METRO MANILA</b>		
Caloocan	Manila	Pateros
Las Pinas	Marikina	Quezon City
Makati	Muntinlupa	San Juan
Malabon	Navotas	Taguig
Mandaluyong	Paranaque	Valenzuela
Pasay	Pasig	
<b>METRO CEBU</b>		
Cebu City	Mandaue City	
Lapu-lapu City	Talisay	
<b>METRO DAVAO</b>		
Agdao	Calinaw	Talomo
Baguio	Marilog	Toril
Bonawan	Paquibato	Tugbok
Buhangin	Poblacion	
<b>CALABARZON</b>		
Batangas	Laguna	
Cavite	Pampanga	
<b>CEBU INDUSTRIAL AREAS</b>		
Cebu City	Mandaue City	
Lapu-lapu City	Talisay	

**FIELDWORK:** July 3 – August 31, 2003

# TECHNICAL DETAILS

## METHODS AND PROCEDURES

1. Lists of government-run public health facilities/hospitals were gathered from the Department of Health. A list of public health facilities/hospitals and industrial zone clinics were also obtained from Local Government Units.
2. Lists of industrial companies were gathered from the Department of Trade and Industry and the Department of Labor and Employment.
3. With the list gathered from DOH, LGU, DTI and DOLE:
  - a) Field interviewers approached the administration department of each hospital to obtain the list of Health Providers working in OB wards, delivery rooms, OPD, and family planning clinics.
  - b) Rural Health Units, Bgy. Health Centers, Bgy. Health Stations, and Lying-in Clinics were also visited to get the list of Health Providers working in these facilities.
  - c) Industrial companies with 100 regular employees were contacted in order to get the names of Health Providers working in their clinics.
4. After obtaining the list of Health Providers from each facility, field interviewers then proceeded to set an appointment with the Health Providers so they could be validated via an interview. The interview content was approved by the client.

# TECHNICAL DETAILS

## LIMITATIONS OF THE CENSUS

The census aimed to cover the entire population of Health Providers offering family planning services in the target areas. However, in the course of the field work, some obstacles came up which hindered the research agency from accomplishing its mission. Below are the reasons for not being able to cover 100% of the Health Providers:

1. In Metro Manila, the intent was to cover facilities in all 17 cities and municipalities. However, in the City of Manila, only three public hospitals and three lying-in clinics were covered because the City Mayor through the City Health Officer did not allow the conduct of any kind of Family Planning study in the city.
2. There were Health Providers who were not available for interview during the duration of the census fieldwork even after more than 2 callbacks which exceeded set industry standards on callbacks. They were on leave, out of town, on training, or simply unavailable.
3. Upon instructions of the client, military and specialty hospitals were excluded in the census.

**Table A. Facilities Covered by Area**

AREA/FACILITY	TOTAL FACILITIES	FACILITIES COVERED	% COVERED	REASONS WHY NOT 100%
<b>METRO MANILA</b>				
Hospitals	50	25	50%	Phil. General Hosp. And Jose Reyes Memorial Hospital administration refused; other hospitals are specialty or military hospitals

# VOLUME II

# KAP ON HEALTH PROVIDERS

# TECHNICAL DETAILS

## RESPONDENTS AND SAMPLING METHODS

Respondent qualifications as defined by the client are as follows:

### **Licensed Health Providers in public health facilities/hospitals and industry clinics:**

- **Doctors** (Obstetricians/Gynecologists, General Practitioners and Family Medicine Practitioners)
- **Midwives** (Hospital-based Midwives, Rural health Unit Midwives, Barangay Health Station Midwives)
- **Nurses** (Hospital-based Staff Nurses, Rural Health Unit Nurses, and Nurses in Industry Clinics)

*Public health facilities/hospitals* refer to government hospitals, provincial hospitals, district hospitals, city hospitals, rural health units and barangay health stations/centers.

*Industry clinics* refer to clinics located within the industrial sites that are either inside or outside company premises. Company clinics outside the industrial sites are those accredited by a company to provide health services to its employees.

# TECHNICAL DETAILS

## RESPONDENTS AND SAMPLING METHODS (cont'd)

Using the output of the census as sampling frame, a total of 750 respondents were selected using systematic random sampling. This means, each provider within each category (field expertise and area) had an equal chance of being chosen.

The number of respondents chosen by expertise and by area are as follows:

<u>LOCATION</u>	<u>DOCTORS</u>	<u>MIDWIVES</u>	<u>NURSES</u>	<u>TOTAL</u>
<b>Metro Manila</b>	100	100	100	<b>300</b>
<b>Metro Cebu/Davao</b>	75	100	100	<b>275</b>
<b>Industrial Zones</b>	75	0	100	<b>175</b>
<b>TOTAL</b>	250	200	300	<b>750</b>

The margin of error at a 95% confidence level for the respective sample sizes are as follows:

750	+/- 4
300	+/- 6
275	+/- 6
250	+/- 6
200	+/- 7
175	+/- 7
100	+/- 10
75	+/- 11

# TECHNICAL DETAILS

---

## METHODS AND PROCEDURES

Interviewing was conducted face to face, using a structured questionnaire.

A draft questionnaire was submitted to the client for review. Upon approval of the draft questionnaire, a pre-test was conducted with the participation of TSAP-FP staff. Based on the results of the pre-test, the draft questionnaire was finalized which AED approved.

# FIELDWORK

---

## 1. TRAINING

Training was conducted in Quezon City, Cebu City and Davao City all of which was supervised and participated in by a TSAP-FP staff.

Training activities included:

- One or two days office training to learn the basics of the project.
- Mock interviews with co-workers to get accustomed to the flow of interviewing and questionnaire format
- Practice interviews with a supervisor around until the interviewer can be left on her own

A Field Interviewer (FI) was left on her own only after she has conducted three (3) successive interviews without committing any error in interviewing and recording.

## 2. SUPERVISION

Three (3) supervisors reporting to the Field Manager monitored the study full-time. They observed interviews, did follow-ups and surprise checks on the research team. They also ensured that field logistics were received promptly and administered properly.

# FIELDWORK (cont'd)

---

## 3. SPOT CHECKING

Spot-checking was done in various stages of field work. The first one took place after about 30% interviews were completed. The second spot-checking was conducted after 60% completion and the last one, immediately after 90% completion of interviewing.

During the spot-checking, around 20% of the finished interviews were re-interviewed.

## 4. FIELD EDITING

After each interview, the field interviewer was asked to go over her own work and check for consistency. All accomplished interview schedules were submitted to the assigned group supervisor who, in turn, edited every interview. Office editors conducted a final consistency check on all interviews prior to coding.

## 5. FIELDWORK PERIOD

September 12 – November 5, 2003

# DATA PROCESSING

---

1. Interview sheets were edited/checked twice before the information were coded.
2. Double encoding for verification was done.
3. A data entry computer program further checked the consistency of the encoded data before data tables were generated.
4. Design of data tables was submitted to client for approval. In addition, technical guidance was provided by Dr. Ric Gonzales and Dr. Ruth Gamaro in finalizing the code frame used in the study.

# WEIGHTING PROCEDURE

To be able to add the Health Providers and come up with a Totals column in the data tables, census-based population weights were applied to the various area domains. The population of each segment obtained in the Census was used to come up with the appropriate projection factors so that each segment is represented according to their proportion in the Totals column of the data tables.

$$\begin{array}{ccc} \text{Projection Factors} & = & \frac{\text{Population}}{\text{No. of Interviews}} \\ \text{(weights)} & & \end{array}$$

<b>DOCTORS</b>

# HOW TO READ TABLES

Below are some guidelines in reading the data tables in this report.

1. Percentages are derived from the base value given at the top of each table (in the “base – total line”)
2. “Wtd” (Weighted) figures mean these are projected figures basing on Census results. This should not be mistaken as the sample size. “Unwtd” (Unweighted) figures, on the other hand, are the actual count of respondents.
3. An asterisk (\*) indicates that the percentage is less than 0.5%
4. A blank cell indicates nil.
5. Values sometimes add to slightly less or slightly more than the indicated total due to the rounding process used by the computer.
6. In reading data, it should be borne in mind that a base of 31 – 99 respondents is considered a small base, 30 or lower is considered a very small base. Therefore, analyze the corresponding data with caution.

# SUMMARY

# SUMMARY

---

## Practices on Providing Family Planning Information

1. Given a list of instances where they may provide FP information, majority of Health Providers say that they provide FP information to all their patients who are of reproductive age even if they do not ask for it (66%). On the other hand, a plurality say they provide FP information to all their patients who have more than 2 - 3 children even if they do not ask for it (40%).
2. A large proportion of Health Providers estimate that only 1-40% of their total consultations are family planning - related (70%). This is further affirmed by the fact that more than half agree to the statement “*very few patients ask me about family planning*” (59%). It is a different picture though when it comes to their pre and post-natal patients where most of Health Providers claim that they provide family planning counseling to all their pre (79%) and post-natal (85%) patients.
3. Most of the facilities provide methods (74-97%) but less counseling (41-57%) with the exception of on-site industry clinics where more counseling is provided (71%) than method (62%). Promotion is practiced more in City/provincial hospitals (44%), Rural Health Units (44%) and Barangay Health Stations (41%).

# SUMMARY

## Mechanism of action and side-effects of modern family planning methods

4. While a majority of Health Providers believe that none of the FP methods is abortifacient (70%), a good 30% believe that some are. Of the methods, IUD garners the highest vote as an abortifacient (27%).
5. Mechanism of action of modern contraceptives have acquired certain associations.

### Oral Pill

Given 15 statements about the pill, the ones that come out more popular are:

- ↗ causes weight gain (71%);
- ↗ can cause or aggravate high blood pressure (55%); and,
- ↗ can cause migraine (55%).

### IUD

Out of 6 statements on IUD the most popular is that it causes pelvic infection (47%). Almost a third even think that it causes abortion (27%), a belief shared by more doctors.

### Injectable

As regards the injectable, out of 11 statements, 2 come out more prominent:

- ↗ can cause amenorrhea leading to or aggravating high blood pressure (43%) and
- ↗ migraines (40%).

# SUMMARY

---

## Male and Female Sterilization

Out of 5 statements on ligation, the more popular belief is that it can cause ectopic pregnancy (19%). Out of 4 statements on vasectomy, garnering the highest agreement, though minimal, is that it can cause a loss of sexual libido (8%).

## Other Modern Methods

As regards other modern methods like mucus/Billings, basal body temperature, LAM, sympto-thermal method and standard days' method, Health Providers admit that they do not know much about these methods to confidently recommend them or that these are inconvenient / difficult for patients to use.

# SUMMARY

---

## Attitudes on Family Planning

6. Health Providers believe that being in the service of providing family planning services do not diminish their public image as professionals.
7. Religious beliefs affect their prescribing practices. They admit as such, but this does not deter them from recommending modern family planning methods such as oral pill, male condom, IUD, injectable, ligation, vasectomy, LAM, mucus/Billings, thermometer, sympto-thermal and standard days' methods.
8. In general, there is hesitation to recommend FP methods to singles which is affirmed in their practice.
9. Health Providers are highly respectful of the right of patients to decide on the method to use. They are not likely to impose their preferences on their patients. They also put emphasis on spousal consent especially as it concerns permanent methods like ligation and vasectomy.
10. Health Providers are also very respectful of patient's right to know the advantages and disadvantages of FP methods.

# SUMMARY

---

## Prescribing Practices

11. The prescribing practices of Health Providers can be summarized as follows:

- a) Modern methods like oral pill, IUD, injectable, male condom, LAM and ligation are more frequently prescribed or recommended than mucus/Billings, thermometer, standard days', sympto-thermal and traditional methods.
- b) Compared to ligation, vasectomy is less recommended because Health Providers have fewer male patients.
- c) Withdrawal is prescribed by 1 out of 2 Health Providers (45%).
- d) For limiting the number of children permanent methods are preferred i.e. ligation (92%) and vasectomy (75%).
- e) More than half do not recommend a traditional method (55%).

# SUMMARY

---

## Usage of FP-related Literature

12. Health Providers to start with are not aware of medical literature such as DARE (97%), National Guidelines Clearing House (93%), Cochrane Database of Systemic Reviews (91%), PubMed (91%), and MedLine (83%). Most of them have not heard of Evidence-Based Medicine (81%) as well.

Neither are they aware of the WHO Medical Eligibility Criteria for Starting Contraceptive Methods (87%).

13. The best known reference is the Green Book or the National Family Planning Service Guidelines (53%) which most of those aware claim to follow (76%).

## How Health Providers Keep themselves Updated

14. Health Providers rely on lectures or workshop which 68% had attended in the past year to update themselves on Family Planning. Most of them had attended a post-licensure training course on family planning (65%). Reading is not too widespread (56% had read medical article/literature in past 4 weeks)

# KEY FINDINGS

# A. PERSONAL DATA

## 1. Type of Facility

As expected, most respondents come from public health facilities (87%), particularly health centers (56%). More doctors come from public hospitals while more midwives come from BHS and health centers.

Most Health Providers interviewed in Metro Manila work in health centers (75%). Those in Metro Cebu / Metro Davao work in either barangay health stations (31%), health centers (23%) or rural health units (19%).

## 2. Gender

Nine in ten (90%) respondents are female, although among doctors, there is a higher representation of males (27%).

## 3. Age Group

Most respondents are themselves in the productive age between 20-39 years old (56%). With more than half (55%) within 20-34 years old, nurses are relatively younger than either doctors (37%) or midwives (38%). Because more of them are nurses, Health Providers in Industrial Zones tend to be younger at 20-34 years old (66%) than those in other areas.

## 4. Civil Status

Three in four are either married or living-in (74%). Most midwives are married (83%). Health Providers within 20-39 years old tend to be single while those beyond 40 years old are likely to be married.

## 5. Religion

Roman Catholic is the dominant religion (83%), like the general Philippine population.

## B. TYPES OF SERVICES OFFERED

### 6. FP Services Offered per Facility

Most of the facilities provide methods (74-97%) but less counseling (41-57%) with the exception of on-site industry clinics which provide more counseling (71%) than methods (62%). Promotion is relatively prominent in City/Provincial Hospitals (44%), Rural Health Units (44%) and Barangay Health Stations (41%). Rural Health Units lead in delivering motivation (38%).

## C. PROFILE OF PATIENTS

---

### 7. Average Patients per Day

Health Providers' estimate of the average number of patients they handle per day varies from an average of 31 to 61. Midwives register the most number of patients averaging 59 per day while doctors have fewer (average of 44). Metro Manila patients average 61 per day or double that of Metro Cebu / Davao and Industrial Zones.

Again from the estimates made by the Health Providers interviewed, they average 21 pre-natal patients and 15 post-natal patients per day. That there are more pre-natal than post-natal patients per day suggests that some do not come back for consultations after giving birth.

### 8. Proportion of Male-Female Patients

Health Providers' estimates of gender distribution of patients, put the proportion of female patients at an average of 77 patients out of every hundred.

A fifth of doctors claim that they do not have male patients at all (21%).

## C. PROFILE OF PATIENTS

---

### 9. Age of Patients

With the use of a showcard, Health Providers were made to profile their patients according to age. It is their perception that their patients are mostly young, below 30 years old (83%). More Health Providers in Metro Cebu / Davao service older patients who are in their middle age, elderly, and senior citizens.

### 10. Percent of FP-related Consultations

FP-related consultations is relatively small with some 45% of Health Providers estimating 20% or less of consultations to be FP-related. Compared to doctors and nurses, midwives score a higher proportion of FP-related consultations.

However, Health Providers claim that FP Counseling on pre (79%) and post-natal (85%) patients is a given for most patients, a service that is more pronounced in Metro Manila.

## D. BELIEFS ON REPRODUCTIVE HEALTH & CONTRACEPTIVES

---

### 11. When Does Pregnancy Occur

Between two options shown in a card, a majority of Health Providers believe that pregnancy occurs during fertilization (68%) rather than after implantation of a fertilized egg in the endometrium (32%). That it occurs during fertilization is a belief held by even more doctors and by Metro Manila Health Providers .

There are no significant differences in their belief regardless of religion.

### 12. FP Method which Causes Abortion

With the use of a showcard where the different FP methods were listed, Health Providers were asked which of these do they think causes abortion. Seven in ten (70%) Health Providers say that none of the FP methods is abortifacient.

On the other hand, a substantial 30% nominate a modern FP method to cause abortion, foremost of which is IUD (20%) followed by the oral pill (12%). Doctors, in fact, register the highest percentage in believing that some FP methods are abortifacient (41%).

# E. MECHANISM OF ACTION OF FP METHODS

## 13. Mechanism of Action: Oral Pill

Given a questionnaire to fill up by themselves, among a list of statements concerning the oral pill, the more popular beliefs among Health Providers come out to be:

- ✚ oral pill causes weight gain (71%);
- ✚ can cause migraines (55%);
- ✚ can cause (or aggravate) high blood pressure (55%);

A substantial minority believe that the oral pill can:

- ✚ bring on menopausal symptoms like irritability (39%);
- ✚ cause cardiovascular disease (29%);
- ✚ cause breast cancer (24%);
- ✚ adversely affect a return to fertility (23%);
- ✚ accumulate in the body necessitating a rest period after prolonged use (22%);
- ✚ cause cervical cancer (21%);
- ✚ cause uterine cancer (20%); and,
- ✚ cause birth defects (20%).

Except for a few statements, midwives generally register the lowest percentage who consider the statements true.

CAN SHRINK WOMEN'S BREASTS	4	4	6	2	4	2	5

# E. MECHANISM OF ACTION OF FP METHODS

## 14. Mechanism of Action: Injectable

Statements on injectable that garner relatively high votes as being true are:

- ↳ can cause amenorrhea leading to or aggravating high blood pressure (43%);
- ↳ can cause migraines (40%);

These statements, on the other hand, hold true for a substantial minority:

- ↳ can bring on menopausal symptoms like irritability (32%); and,
- ↳ can adversely affect a return to fertility (29%).

As with the statements on the oral pill, midwives register the least number of agreement on the statements regarding injectable.

In addition, Health Providers in Metro Cebu / Davao are less inclined to affirm the statements on injectable except on coital dryness and sexual libido.

CAN CAUSE BREAST CANCER	14	25	13	6	15	8	15
CAN CAUSE UTERINE CANCER	13	17	15	9	15	7	15

## E. MECHANISM OF ACTION OF FP METHODS

### 15. Mechanism of Action: IUD

About half of Health Providers consider the statement that IUD can cause pelvic infection to be true (47%).

Other beliefs shared by a substantial minority are:

- ↳ can cause abortion (27%);
- ↳ can cause anemia in women (24%);
- ↳ physical exertion can cause an IUD to “fall out” (23%); and,
- ↳ has an “opening effect” on the uterus (20%).

It is interesting to note that when asked outrightly which FP methods do they think are abortifacient, 20% spontaneously nominated IUD (page 58). However, in the self-administered questionnaire, a significantly higher number consider it true that IUD is, indeed, abortifacient (27%).

The belief that IUD can cause pelvic infection and abortion is shared by more doctors and Health Providers in Industrial Zones.

### 16. Mechanism of Action: Standard Days' Method

The statement that the contraceptive protection of the standard days' method is very comparable with that of hormonal contraceptives and IUD, is taken as true by a third of Health Providers interviewed (31%).

More doctors and nurses believe the statement on standard days' Method as true.

## E. MECHANISM OF ACTION OF FP METHODS

### 17. Mechanism of Action: Vasectomy

A very small minority (3-8%) find the statements on vasectomy as true. Nurses score highest in thinking that vasectomy can cause a loss of sexual libido (12%).

Health Providers in Industrial Zones are more likely to think that it can cause a loss of sexual libido (19%) and that it can cause erectile dysfunction (12%).

### 18. Mechanism of Action: Tubal Ligation

One in five believes that tubal ligation can cause ectopic pregnancy (19%). This belief is more prevalent among doctors and Health Providers in Metro Manila and Industrial Zones.

A large proportion is aware that spinal anesthesia is not required before performing tubal ligation (75%). Still a good 25% think otherwise or does not know the answer.

### 19. Whether or Not Pap Smear is Required Before Prescribing Any FP Method

Three in four respondents believe that pap smear is required before prescribing any FP method (76%). Health Providers in Industrial Zones are more likely to adhere to this.

## F. ATTITUDES TOWARDS FAMILY PLANNING

20. To find out the attitude of Health Providers as regards certain FP issues or concerns, 12 statements were given to Health Providers to agree or disagree on.

Based on their response to a statement, it can be gleaned that Health Providers do not feel diminished by offering FP services. Ninety-one percent of doctors/midwives/nurses who offer family planning services do not think they have a negative image in the Philippines just because they are offering FP services.

21. Health Providers agree almost unanimously to the statements: 1) a doctor/midwife/nurse should tell their patients the advantages as well as the disadvantages of family planning methods (99%), and that 2) health risks increase for women who give birth to too many children (98%) and 3) it is important to make modern contraceptive products easily available so the number of unplanned pregnancies can be reduced (87%).
22. Health Providers are respectful of their patient's right to decide on FP methods to adopt since a large proportion of them disagree to the statement that Health Providers should be the one to decide on the family planning method for their patient (72%). Opinion is divided as regards the statement "if husband/wife/partner does not approve of the method, a woman/man should not use or practice the method". However, more Health Providers in Industrial Zones as well as doctors tend to favor the statement.

## F. ATTITUDES TOWARDS FAMILY PLANNING

23. A majority of Health Providers agree to the statement that very few patients ask them about family planning (59%) which affirms the claim of 1 in 2 Health Providers that only 1-20% of their consultations are FP-related. Considerably more doctors and Health Providers in Industrial Zones can relate with the statement.
24. Health Providers, however, disagree to the statement that they discuss contraception only when a patient brings up the subject (88%).
25. Health Providers are reluctant to prescribe contraceptives to an unmarried woman (73%). Reluctance is more prevalent among nurses and midwives, Health Providers in Metro Cebu / Davao and Catholics.
26. To a certain degree, Health Providers acknowledge the effect of religion when prescribing contraceptives. Majority admit that religious teachings in the Philippines affect the types of family planning methods they recommend to patients (59%). Relatively fewer midwives agree with this statement. On the other hand, most do not agree that recommending modern family planning methods are against their religious beliefs (82%). More non-Catholics than Catholics also do not agree with the statement.
27. Health Providers are in general disagreement that most patients think the medical service offered in the private sector is better than the medical service offered in the public sector (81%). Midwives and Health Providers in Metro Manila register the strongest disagreement.

# G. PRESCRIBING PRACTICES

28. Prescribing practices of Health Providers are summarized below:

	TOTAL
<b><i>FP Method Recommend</i></b>	<p>Modern methods, e.g., pill (97%), ligation(94%), LAM (94%), injectable (93%), condom (93%) and IUD (92%) are way ahead among the modern methods while mucus/Billings (66%), thermometer (58%), sympto-thermal (52%) and standard day's (52%) methods are way behind.</p> <p>Vasectomy is recommended less than ligation (76% vs 94%)) because of fewer male patients.</p> <p>Traditional methods though much less recommended than modern methods are relatively popular: calendar (75%) and withdrawal (45%).</p>
<b><i>FP Method Recommend for Child Spacing</i></b>	<p>Pattern of recommendation is almost the same as above except that noticeably IUD is less recommended for child spacing (79%). Permanent methods like ligation and vasectomy are not for this purpose.</p>
<b><i>FP Method Recommend for Limiting Number of Children</i></b>	<p>More permanent methods are preferred for limiting the number of children i.e. ligation (92%) and vasectomy (75%).</p>
<b><i>FP Method Never Recommend</i></b>	<p>One out of two do not recommend traditional methods (55%) or modern methods like standard days' (48%) or sympto-thermal (47%). A plurality also do not recommend thermometer (42%),or mucus/Billings (34%).</p>

# G. PRESCRIBING PRACTICES

	METRO MANILA	METRO CEBU/DAVAO	INDUSTRIAL ZONES
<i><b>FP Method Recommend</b></i>		Low inclination for Billings (52%), thermometer (41%), sympto-thermal (37%), standard days' (29%)	High inclination for traditional methods, e.g. calendar (94%) & withdrawal (58%).  Ligation (76%), injectable (79%), IUD (73%) & vasectomy (65%) are de-emphasized  High on mucus/Billings (74%), thermometer (65%), sympto-thermal (62%)
<i><b>FP Method Recommend for Limiting Number of Children</b></i>			A few do not recommend any method for preventing child birth (21%)
<i><b>FP Method Never Recommend</b></i>		A majority never recommend traditional methods (77%) and less popular modern methods like sympto-thermal (62%), thermometer (59%), standard days' (56%).	Reluctant to recommend IUD (27%), injectable (20%) and more permanent methods e.g. vasectomy (35%) and tubal ligation (24%)

## G. PRESCRIBING PRACTICES

29. Health Providers give varied reasons as to why they do not recommend a certain method. The main reasons (around 10% and higher) are summarized below:

	IUD	INJECTABLE	CONDOM	VASECTOMY	LIGATION
<b><i>Reasons why Never Recommend</i></b>	Varied reasons given, with focus on: side effects reported by patients (15%) as well as by parents of patients (13%); no training (16%) and against religious belief/pro-life (17%).	Patients report side effects (17%) as well as experienced by their parents (13%), patient prefer other methods /does not ask about this method (16%), pro-life/ against religion (20%).	Patients do not ask about method (49%), against religion/prolife (13%).	Patients do not ask about method (41%) since there are few male patients, patients prefer other methods (12%), no training(14%).	Against religion/pro-life (19%), inappropriate for patient's age (14%), no training (13%), method not available (13%).

## G. PRESCRIBING PRACTICES

	BILLINGS	SYMPTO-THERMAL	LAM	THERMOMETER	STANDARD DAYS'
<i>Reasons why Never Recommend</i>	No training (32%), difficult/inconvenient to use (26%), difficult to explain to patient (23%), high failure rate (14%).	No training (41%), difficult/inconvenient to use (24%), difficult to explain to patients (17%).	High failure rate (34%), no training (30%) difficult/inconvenient to use (24%).	Difficult / inconvenient to use (39%), difficult to explain to patients (14%), no training (26%), high failure rate (11%).	No training (56%), difficult/inconvenient to use (11%), method not yet available (11%).

	CALENDAR	WITHDRAWAL
<i>Reasons why Never Recommend</i>	High failure rate (65%), difficult/inconvenient to use (17%).	High failure rate (60%), patient experience side effects (15%), side effects experienced by parents (10%).

## G. PRESCRIBING PRACTICES

---

30. As suggested earlier (page 79), Health Providers are reluctant to recommend FP methods to unmarrieds. Those who recommend condoms or oral pill are the more likely to recommend the method to an unmarried person (55% and 28% respectively). Health Providers who recommend other methods hardly prescribe these to unmarrieds.
31. Partner's consent is a requirement for permanent methods. Health providers who recommend the method are unwilling to perform tubal ligation (80%) and vasectomy (75%) if the patient does not show proof of spousal consent. They are not as strict though with non-permanent methods, i.e. relatively fewer Health Providers require spousal consent with IUD (51%), injectable (50%), pill (42%), condom (33%).

## G. PRESCRIBING PRACTICES

---

32. In accordance with their belief (page 72), a large majority do not give spinal anesthesia before performing tubal ligation (84%).
33. Apparently, even if a majority of Health Providers believe that a pap smear is required before prescribing contraceptives (page 73), in practice, fewer admit they actually require this from their patients (60%).
34. Given a showcard containing a list of possible situations that Health Providers may provide family planning information to patients, majority of them say that they provide FP information to all their patients who are of reproductive age even if they do not ask for it (66%). More midwives and Health Providers in Metro Manila and Metro Cebu / Davao do this.  
  
A plurality say they provide FP information to all their patients who have more than 2 or 3 children even if they do not ask for it (40%).

## G. PRESCRIBING PRACTICES

### 35. Minimum / Maximum age Required before Prescribing Method

- a) A majority of those who recommend the method believe that male condom (86-88%), vasectomy (79-80%), IUD (65-72%), tubal ligation (58%), and injectable (52-60%) do not have a prerequisite minimum or maximum age for users. As regards the oral pill, fewer Health Providers say that there is no maximum age (31%) for the method than those who say there is no minimum age for the oral pill (54%).
- b) Among those who assert that there is a minimum age required, most would consider even 18-20 year-olds can adopt the male condom (97%), oral pill (93%), injectable (69%), and IUD (58%). Based on responses which is rather spread out, modal minimum age for ligation (33%) and vasectomy (32%) is 26-30 years old.
- c) Based on responses, median maximum age set for oral pill and injectable are 36 and 39 years old, respectively, while for IUD, ligation and vasectomy, it is set at 40 years old.

### 36. Minimum Number of Patient's Children Required before Prescribing Method

- a) Permanent methods, tubal ligation (83%) and vasectomy (69%) are mainly the FP methods thought to require a minimum number of children. More providers in Metro Cebu / Davao say this.
- b) Among those who say there is a minimum number of children for the methods, the more popular belief is that a minimum of 3 children is required before tubal ligation and vasectomy can be performed.

## 37. What Done When FP Provider Can Not Answer Patient's Questions

- a) Difficult situations are usually referred to a doctor. Nurses and midwives claim that they refer patients (47-62%) to or consult (22-24%) a physician/doctor when they can not answer patients' questions.
- b) It is interesting to note that doctors would refer such cases to co-doctors who would be specialists or who would be more knowledgeable (54%).

## H. AWARENESS & USAGE OF FP-RELATED LITERATURE

38. Most Health Providers are not aware of FP-related literature (83-97%). Health Providers are generally not aware of the following: DARE (97%), National Guidelines Clearing House (93%), Cochrane Data Base of Systemic Reviews (91%), PubMed (91%) and MedLine (83%).
39. Only 1 in 2 of the few who are aware use any of the above-mentioned literature (44-57%) and DARE is used by even fewer (31%). Frequency of usage of MedLine, PubMed, Cochrane Database of Systemic Reviews and National Guideline Clearing House is either once a week (19-30%) or once a month (12-33%).
40. Awareness of Evidence-Based Medicine or EBM is relatively higher though only a minority are aware of it (19%). Most doctors compared to nurses and midwives, however, are aware of EBM (64%).

The few Health Providers who are aware, learned from seminars/training/lectures/workshops (59%), medical journals/magazines (25%) and friends and colleagues (23%).

41. Awareness of WHO Medical Eligibility Criteria for Starting FP methods is lean among Health Providers. Even after showing the book cover, only 13% claim to be aware of the publication with doctors (15%) and midwives (16%) leading in awareness.

The few who are aware consider the five pre-listed statements on WHO Medical Eligibility Criteria shown in Chart 30 as true (51-93%).

## H. AWARENESS & USAGE OF FP-RELATED LITERATURE

42. Shown a facsimile of the Green Book, as locally referred to, otherwise The National Family Planning Service Guidelines, half of Health Providers acknowledge having heard or read it (53%). More midwives, Health Providers in Metro Manila and non-Catholics are aware of the Green Book.
43. Most of those aware of the Green Book or The National Family Planning Service Guidelines claim to follow its policies (76%) particularly Health Providers in Metro Manila and Metro Cebu / Davao and those 40 years old and older.

Although most users of the Green Book or The National Family Planning Service Guidelines say that Chapters 2 (Counseling in Family Planning) and 4 (Methods of Family Planning) are very relevant (82-85%), relatively less users find it very easy to understand (69-70%) and significantly much less find these very easy to implement (43-48%).

44. The main reason given for non-usage of the Green Book is non-availability of a copy (75%).

## H. AWARENESS & USAGE OF FP-RELATED LITERATURE

---

45. Majority claim to follow other guidelines in providing FP services (62%) particularly Health Providers in Metro Cebu / Davao and Industrial Zones. Doctors in Metro Manila tend not to follow other FP guidelines in providing services.

Those who claim to follow guidelines mainly use reference materials, e.g. leaflets, flyers, pamphlets, handouts (59%), which are mostly given by DOH.

## 46. Family Planning Post-Licensure Training/Course Attended

- a) Majority claim to have attended a post-licensure training / course on family planning (65%). Highest attendance is registered by midwives (73%) and those who are 40 years and older (84%); lowest attendance is among Health Providers in Industrial Zones (36%).
- b) Among those who have participated in a post-licensure training on family planning, Health Providers recall two major training courses which they have attended:
  - Basic Comprehensive FP Training Course (44%) and
  - Basic FP Training Course on All Methods Except IUD Insertion, Tubal Ligation and Vasectomy (27%).

Not too many mention having attended FP Counseling Skills Training on Gather Approach (19%) and General Family Planning Orientation (18%).

## J. KEEPING UP-TO-DATE ON MEDICAL SCIENCE

### 47. How Keep Updated on Medical Science and Developments in Field of Expertise

- a) Health Providers claim to keep themselves updated on medical science and developments in their field of expertise mainly by attending seminars/training/conferences (84%). However, fewer Health Providers in Industrial Zones are able to do this (72%).

Reading medical journals / magazines is the next best way that providers update themselves (53%) although fewer providers in Metro Cebu / Davao claim to do this (37%).

Only a tenth surf the web/internet (11%) which is relatively much more popular among doctors (20%) and nurses (16%) and Industrial Zone Health Providers (38%).

- b) Despite the claim of a large majority of respondents that they keep themselves updated by attending seminars/training/conferences, only 68% admit to have gone to educational lectures and workshops in the past 12 months. Pulling the average down is the lower attendance of nurses (62%) and midwives (65%) and Metro Manila Health Providers (65%).
- c) A plurality say they have spent 1-5 days attending educational lectures and workshops in the past 12 months (39%) .

## J. KEEPING UP-TO-DATE ON MEDICAL SCIENCE

---

### 48. Medical Article/Literature Read

- a) When asked when was the last time they had read a medical article or literature from a medical journal or magazine, only a small minority had read in the past 6 days including the day of the interview (26%). However, if one considers the past 4 weeks, about half had done so (56%); the other half over four weeks ago (17%) or cannot remember how long ago that was (27%).

Doctors register the highest readership of medical literature in the past 6 days.

- b) Majority (60%) claim that they last read 1 -2 medical articles.
- c) These articles were from magazines (23%) and medical health journals (11%). The most popularly read magazine is HEALTH BEAT (8%). Health Providers who could not remember the source of their last reading material simply mentioned the topic read which is mainly on non-family planning related topics about health such as hypertension, diabetes, SARS, dengue etc. (28%).
